

Development Program for State Fiscal Service's Information System for 2025-2027 approved by Government

The Government has approved the Development Program for State Fiscal Service's Information System for 2025-2027. The document outlines the strategic vision, essential priorities, and planned initiatives for accelerating digital transformation and ensuring interoperability with the European Union's tax systems.

The main objectives relate to interconnection and interoperability with EU systems, strengthening data protection measures, modernizing technical infrastructure, data automation and analysis, as well as optimizing the information system infrastructure.

The impact on the private sector will be reflected in reducing administrative burden, data security and privacy, integration into the EU market, and as a result, improving the relationship between the business environment and tax administration.

At the same time, the implementation of the Program will reduce the need for printing and archiving documents in physical format, thanks to the automation of information exchange between institutions through the MConnect solution.
